                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  /note="Vector: pAMP10; Site_1: Not1; Site_2: EcoRI; 1st strand cDNA was primed with oligo(dT),17 on 50 ng of DNAse-treated, total cellular RNA obtained from 5,000-10,000 microdissected cells histologically-determined to be fully malignant prostate cancer cells. Double-stranded cDNA was ligated to EcoRI adaptors, 5 cycles of PCR applied to the cDNA with an adaptor-specific primer, and the resulting PCR product subcloned into pAMP10 by the UDG-cloning method (Life Technologies). Average insert size is 600 bp. NOTE: Not directionally cloned. This library was constructed by David Krizman."

Sequence 42, Application US/08454720A
Patent No. 5766888
GENERAL INFORMATION:
APPLICANT: Sobol, Robert E.
APPLICANT: Green, Mark R.
APPLICANT: Kawasaki, Ernest S.
TITLE OF INVENTION: Detection of Car
TITLE OF INVENTION: Nucleic Acid Amm
NUMBER OF SEQUENCES: 42
                                                                                                                                                                                                                                                                                                                                                                                                                                                             FEATURE:

```
RESULT 14

US-08-983-075D-10

Sequence 10, Application US/08983075D

Patent No. 6303361

Patent No. 6303361

GENERAL INFORMATION:

APPLICANT: VIHKO, PIIKKO

ITITE OF INVENTION: HUMAN GLANDULAR KALLIKREIN-1 (HK2)

FILE REFERENCE: 1491/44025

CURRENT APPLICATION NUMBER: US/08/983,075D

CURRENT APPLICATION NUMBER: PCT/F196/00382

PRIOR APPLICATION NUMBER: PCT/F196/00382
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    FILING DATE: December 16, 1994
ATTORNEY/AGENT INFORMATION:
NAME: PELTY, DOUGlas
REGISTRATION NUMBER: 35321
REFERENCE/DOCKET NUMBER: 9178
TELECOMMUNICATION INFORMATION:
TELEPHONE: (510) 814-2977
INFORMATION FOR SEQ ID NO: 38:
SEQUENCE CHARACTERISTICS:
LENGTH: 1864 base pairs
TYPE: nucleic acid
STRANDEDNESS: single
TOPOLOGY: linear
MOLECULE TYPE: DNA (genomic)
US-08-454-720A-38
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ; NAME/KEY: misc_feature

The present invention describes a method for detecting the occurrence of a nucleic acid synthesising reaction during the synthesis of a nucleic acid with an enzyme. The method comprises the use of an insoluble substance formed in the reaction as an indication. The method can be used for detecting the presence or absence of a nucleic acid synthesising reaction (especially a nucleic acid amplification reaction). The method is useful in gene analysis, diagnosis of cancer and other diseases, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The patent discloses immunogenic peptides of prostate-specific antigen (PSA) and nucleic acids encoding them. The peptides of the invention are used to prepare a medicament to elicit an immune response in an animal. They are used to treat cancer such as prostate cancer and tumour metastasis. They are also useful for prophylaxis, for preparing monoclonal or polyclonal antibodies, and in conventional techniques of immunology, molecular biology, cell biology and recombinant DNA technology. The present sequence is a DNA encoding PSA derived peptide, CLP314.
                                                                                                                                                                                                                                                                                                  Detecting the product of an enzyme-based nucleic acid synthesizing reaction, useful in gene analysis, diagnosis of cancer and other diseases, and in identifying bacteria, comprises the formation of an insoluble substance -

                  The invention relates to a method for synthesising a nucleic acid using a double-stranded nucleic acid as template and incubating under conditions allowing the establishment of a complementary chain synthesis reaction. The method uses an arbitrary primer to initiate the complementary chain synthesis reaction. The method is particularly useful in gene and disease diagnosis. It is a highly efficient and reaction specific method in which no temperature variation is required. The present sequence is used in an example illustrating the invention.
                                                                                                                                                                 Isothermal amplification of nucleic acids using double-stranded nucleic acid as template to establish complementary chain synthesis reaction from primer enabling base pairing in domain to be annealed, useful e.g. in gene diagnosis -

                                                                                                                                                                                                                                                                                                                     Best
                                                                                                                                                                                                                                                                                                                                                                       The present sequence represents a mRNA target sequence from exons 2 and 3 of the prostate specific antigen (PSA) gene... The sequence is used to exemplify the invention. The specification describes a method for purifying RNA. The method comprises contacting a test sample with polyvalent transition metal ions to form a precipitant and a supernatant, separating the precipitant from the supernatant, and collecting the supernatant to obtain a purified solution of total RNA. The RNA is used for nucleic acid amplification and disease detection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Purification of RNA, used for nucleic acid amplification and disease detection - by precipitating other sample components with transition metal ions, separating and collecting the purified RNA

The detection of PSA mRNA in peripheral blood is associated with metastatic prostate cancer. Detection of PSA mRNA in the bloodstream indicates that prostate cells are circulating in the blood and confirms diagnosis of cancer. Circulating prostate cells also indicate a risk of a secondary tumour or bone metastatic anchoring. Detection of the PSA mRNA after prostatectomy or radiotherapy indicates a risk that the prostate cancer has spread and that the surgery and radiotherapy was not effective. PCR primers AAT92971-73 were used for the monitoring and diagnosis of patients with prostate cancer. The method comprises the

A region is produced at the 3 end of a target sequence which contains sub-sequences designated F1, F2C and F1C, where F1C is the complement of F1. A loop is formed by annealing of F1 to its complementary sequence F1C, and a primer containing a sub-sequence F2 (complementary sequence F1C, and a primer containing a sub-sequence F2 (complementary strand to the template is synthesised using a DNA polymerase, and the process is C2 repeated using sub-sequences at the 3' end of the complementary strand designated R1, R2C and R1C, using a primer containing R2 at its 3' end. C3 designated R1, R2C and R1C, using a primer containing R2 at its 3' end. C4 cand methods for the detection of a nucleic acid sequence in a sample C4 cand methods for the detection of a nucleic acid sequence in a sample C5 cand methods for the detection of a sequence complementary to the loop C6 and methods for the detection of a sequence complementary to the loop C6 can efficient and highly specific method of the invention provides C6 of a target nucleic acid sequence using a simple reagent mixture. C6 The present sequence represents a prostate specific antigen (P5A) C7 gene fragment used as a template for the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

The resent invention describes a new method for synthesising nucleic acids comprising: (a) preparing a nucleic acid, with an F2c region, able to form a loop by annealing the F1 region of the 3' end to the F1c region on the same chain; (b) synthesis of a complementary chain using the 3' end of F1 as the starting point; (c) replacing the complementary to F2c) at its 3' end and using it as a starting point for complementary chain synthesis by a polymerase; and (d) replacing the chain synthesised in step c by annealing a polynucleotide containing a region complementary to a part of the chain and using its 3' end as the starting point. Also described are: (1) a kit for synthesising nucleic acids; and (2) a kit for detecting target base sequences. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Example 8; Fig 17; 96pp; Japanese.

                                  Human kallikrein 2 (hK2) is expressed at elevated levels relative to the prostate cancer antigen, prostate specific antigen (PSA) by breast cancer cells when stimulated by androgens. Detecting levels of hK2 may provide a simple diagnostic tool for detecting or determining breast cancer. Detecting hK2 is achieved by producing an hK2 DNA from hK2 RNA by reverse transcription. The hK2 DNA obtained is then amplified by PCR and detected using probes. Determination of breast cancer may also be determined by exposing the hK2 polypeptide to an agent which binds to it and then detecting the binary complex formed. The amount of complex formed correlates directly to the presence of breast cancer in the human individual. The methods can be used in the diagnosis, treatment and/or monitoring of the progression or remission of breast cancer and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Homo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             sequence represents a prostate specific antigen related sequence, which is used in an example from the present is

The invention relates to a method of inducing a cell-mediated immune cresponse against a cell comprising a target antigen (I) in a subject, treating a subject having undesired cells, for example tumour cells or virally infected cells (C), reducing the number of (C) in a subject, and stimulating presentation of (I) by a cell. This is done by administering a polynucleotide (II) exoding a variant of (I), so that (II) expressed in a cell and cell-mediated immune response is induced. The method can be used to treat prostate cancer, breast cancer, colorectal cancer and pancreatic cancer, as well as lymphomas and leukaemias. The method is also useful in treating chronic viral infections such as those caused by hepadnaviruses, lentiviruses (including human immunodeficiency virus (HIV)), herpesviruses and the flaviviruses and pestiviruses. The present sequence represents the coding sequence of human prostate specific antigen (PSA) variant which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Matches

                                                                                                                                                                                                                                                                                                                              The invention relates to a method of immunization against prostatic cancer (PC) by administering a nucleic acid (this sequence) that encodes prostate-specific antigen (PSA), or its immunologically active fragment, operably linked to regulatory sequences. The nucleic acid is taken up by cells and then expressed to generate an immune response against PSA. The method is used to protect against, or treat, PC, or more generally to induce a cellular immune response to PSA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAZ47134 standard; DNA; 990 BP

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This DNA sequence comprises a 992-bp human prostate specific antigen (PSA) cDNA PCR fragment. New Oligonucleotide primers (AAT91044-53) are designed to amplify the PSA gene but not the human glandular kallikrein gene, which has 75-85% homology to the PSA gene. The primers can be used for diagnostis of prostate cancer micrometastasis. A claimed diagnostic kit for detecting prostate cancer comprises a pair of primers, where one of the primers is selected from those given in AAT91044-53, and a means for visualising amplified DNA (ethidium bromide stain, 32p or biotin). The invention also includes a method of detecting cells which express prostate cancer specific sequences by detecting the presence of nucleic acids specific for prostate cancer or a signal specific for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This sequence is a fragment of the human prostate specific antigen (PSA). The invention relates to a method of detecting prostate cancer micrometastasis in a patient having stage D1, D2, or D3 prostate cancer, comprising: (1) obtaining a sample nucleic acid from a patient tissue; (2) amplifying nucleic acids specific for prostate cancer or amplifying a signal generated by hybridisation of a probe specific to a prostate specific nucleic acid in the sample, comprising hybridisation to at least 1 prostate cancer specific primer which is complementary to a prostate cancer specific gene which does not hybridise to the human glandular kallikrein gene; and (3) detecting the presence of the amplified nucleic acids or the amplified signal where the presence of the amplified nucleic acids or signal indicates micrometastasis of prostate cancer. The method is useful for detecting micrometastasis of prostate cancer. The method allows the detection of a low concentration of cells.
                                                                                                                                                                                                                                                                                       dermatological; antiallergic; antiasthmatic; antidiabetic; cytostatic; neuroprotective; antidepressant; nootropic; antiparkinsonian; infection; immunostimulant; gene therapy; antisense therapy; vaccine; inflammation; antianaphylactic; rheumatoid arthritis; septic shock; pancreatitis; cardiac dysfunction; neuropathology; cardiac anaphylaxis; autoimmunity; genetic disease; haematopoietic disorder; platelet disorder; asthma;
                                                                                                                                                                                                                                                                                                                                                                                                           Human; cancer; ulcer; HIV infection; human immunodeficiency virus; antiinflammatory; antirheumatic; antiarthritic; immunosuppressive; antibacterial; endocrine; cardiant; central nervous system; virucide; anti-HIV; fungicide; antimutagen; cardiovascular; antianaemic; anaemia;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  RESULT 15
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CC AAH99166 to AAH99904 encode the human proteins given in AAM2525 to CC AAM25963. The proteins can have activities based on the tissues and CC cells they are expressed in, such as: antinflammatory; antirheumatic; CC antiarrhritic; immunosuppressive; antipacterial; endocrine; cardiant; central nervous system, virucide; anti-HTV, fungicide; antiaterary; CC antidiabetic; cytostatic; dermatological; antiallergic; antiasthmatic; CC antidiabetic; cytostatic; neuroprotective; antidepressant; noctropic; CC antidiabetic; cytostatic; neuroprotective; antidepressant; noctropic; CC antidiabetic; cytostatic; neuroprotective; antidepressant; noctropic; CC antidiabetic; not munostimulant. *The proteins and polynucleotides cenceding them can be used in gene therapy, antisense therapy and vaccine croding them can be used in gene therapy, antisense therapy and vaccine condinction. The proteins and polynucleotides are useful for screening for agonists or antagonists of a protein and for the treatment and diagnosis of alcorders associated with the activity of a protein e.g. inflammation, constrained arthritis, septic shock, pancreatitis, cardiac dysfunction, confinently, cardiac anaphylaxis, viral, bacterial, HTV and fungal infections, autoimmunity, genetic disease, haematopoietic discorders, canaemia, platelet disorders, thrombocytopaenia, wounds, burns, ulcers, csteeporosis, severe combined immunodeficiency, eczema, allergic CC nlinents, asthma, diabetes, cancer, multiple sclerosis, depression, cCC neuropaical disorders, Parkinson's disease, neurodegenerative and

The present sequence is one of a large number of 5′ ESTs derived from mRNAs encoding secreted proteins. An ORF has been identified within the sequence. The 5′ ESTs were prepared from total human RNAs or polyAr RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3′ untranslated region (UTR) of the mRNA because they are often obtained from oilgo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5′ ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5′ UTR is rarely included. 5′ ESTs are derived from mRNAs with intact 5′ ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5′ ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain vectors.
                                                                                                                                                                                                                                                                                                                                                                                                                                  Claim 1; SEQ ID 3738; 71pp + CD-ROM; English.
